WO 2005/053097 PCT/SE2003/001843

## 10 CLAIMS

1. A sparse array antenna comprising series-fed antenna array columns tuned to a respective transmit and receive frequency, **characterised in** that

transmitting and receiving array columns are formed with a given distance between each transmitting radiator element and each receiving radiator element, the series-fed antenna columns being arranged in parallel to each other, thereby forming a symmetric interleaved transmit/receive array;

receiving array columns operate as parasitic elements in a transmit mode and transmitting array columns operate as parasitic elements in a receive mode, thereby reducing creation of grating lobes.

2. The antenna according to claim 1, **characterised in** that

- a distance between each transmitting antenna array column and each receiving antenna array column is typically increased to be of an order of one wavelength ( $\lambda$ ) to thereby obtain a sparse array.
- 3. The antenna according to claim 2, **characterised in** that
  the series-fed array columns are formed as extended ridged slotted
  wave-guides tuned to a respective transmitting and receiving frequency.
  - 4. The antenna according to claim 3, **characterised in** that when having number n of slots in each slotted transmitting waveguide the number of slots in each slotted receiving wave-guide being generally  $n \pm x$ , where x represents an integer digit (x = 0, 1, 2, 3...).
  - 5. The antenna according to claim 2, **characterised in** that the series-fed array columns are formed as extended transmission lines containing radiation elements, the array columns being tuned to a respective transmitting and receiving frequency.

WO 2005/053097 PCT/SE2003/001843

11

6. The antenna according to claim 1, **characterised in** that

the sparse array antenna is arranged to be scanable to also provide reduced sidelobes entering visual space when scanning the main radiation lobe from an off boresight direction.

5

7. The antenna according to claim 1, **characterised in** that

that each one of the series-fed antenna column is narrowly tuned within a respective frequency band to thereby reduce coupling between the transmitting and receiving bands used.

10

8. The antenna according to anyone of the preceding claims, characterised in that

the series-fed antenna array columns are connected to and fed from an active receive/transmit (T/R) module.

15

9. The antenna according to claim 2, **characterised in** that

only one set of series-fed columns being actively used and another interleaved set of series-fed columns are terminated by a suitable load forming parasitic columns of the sparse array antenna.
